

# *The Weak Acid / Base Rxn*

Recall a balanced equation.

What is on the left side?

The right side?

When you compare the concentration (molarity, [mol/L]) of all reactants and to all products you get something called and equilibrium expression.

Where “K” is the equilibrium constant for that rxn

# *Equilibrium constants for Weak Acids*

$$K_a = \frac{[\text{H}_3\text{O}^+][\text{A}^-]}{[\text{HA}]}$$

Weak acid has  $K_a < 1$

Leads to small  $[\text{H}_3\text{O}^+]$  and a pH of 2 - 7

# *I.C.E. Table Method*

Step 1: Write balanced equation

Step 2: Write equilibrium ( $K_a$ ) expression

Step 3: Construct ICE table and fill in

Step 4: Solve for unknown concentrations using equilibrium values,  
use  $[H_3O^+]$  or  $[H^+]$  to find pH if asked

# *Weak Acid Practice*

If a 3.0M weak acid HF is used to etch glass, we need to find the concentration of  $[H^+]$  ions in the solution.

1. Write the balance ionization/ dissociation of HF.
2. Write the  $K_a$  expression for HF ionization!

## *Practice*

If a 3.0M weak acid HF is used to etch glass, we need to find the concentration of  $[H^+]$  ions in the solution. Given the  $K_a$  of HF as  $6.3 \times 10^{-4}$ .
